

VIRT-EU SANDBOX: Design Dilemmas in Connected Technologies

Presenters:

Alison Powell, London School of Economics

Irina Shklovski, IT University of Copenhagen

Carolina Némethy, IT University of Copenhagen

background: the VIRT-EU project

moral simulation interventions interventions as Ethics the framework futures

We are working at a
company

WearWell

Track your wellbeing while working productively!

WearWell is equipped with GPS, heart rate monitor, step counting and body temperature sensors.

When an employee wears WearWell, s/he will become more aware of their mental and physical wellbeing throughout the day.

WearWell

How should we design WearWell in order to capture the clearest picture of data and give all of us the best suggestions based on that data?

Goals:

- A device to support employee well-being as mental and physical fitness.
- Provide goal-setting capability and feedback based on personalized goal suggestions.
- Allow push notifications to/from management team based on unusual or problematic deviations from established goals and norms
- Ability to “snooze” reminders for helping to achieve established goals

Approach:

- Technical team reviews sensor suite and specs
- UX team develops available interface elements
- We will work with potential users to ensure relevant functionality

Device Sensors:

1. GPS
2. Heart-rate sensor
3. Step-count (accelerometer)
4. Temperature
5. Galvanic skin response

Measuring impact:

- Up-take and feedback from employees
- The number of sick days employees take (reduction in the number of sick days would be evidence of positive impact)
- Keep track of the number of interactions between employees and managers
- Keep track of productivity levels (KPIs)

Security and privacy:

- Employees will have the option of turning off internal location tracking
- Employees will have an option of turning off tracking on weekends
- Managers and employees will have to confirm some more sensitive tracking options together

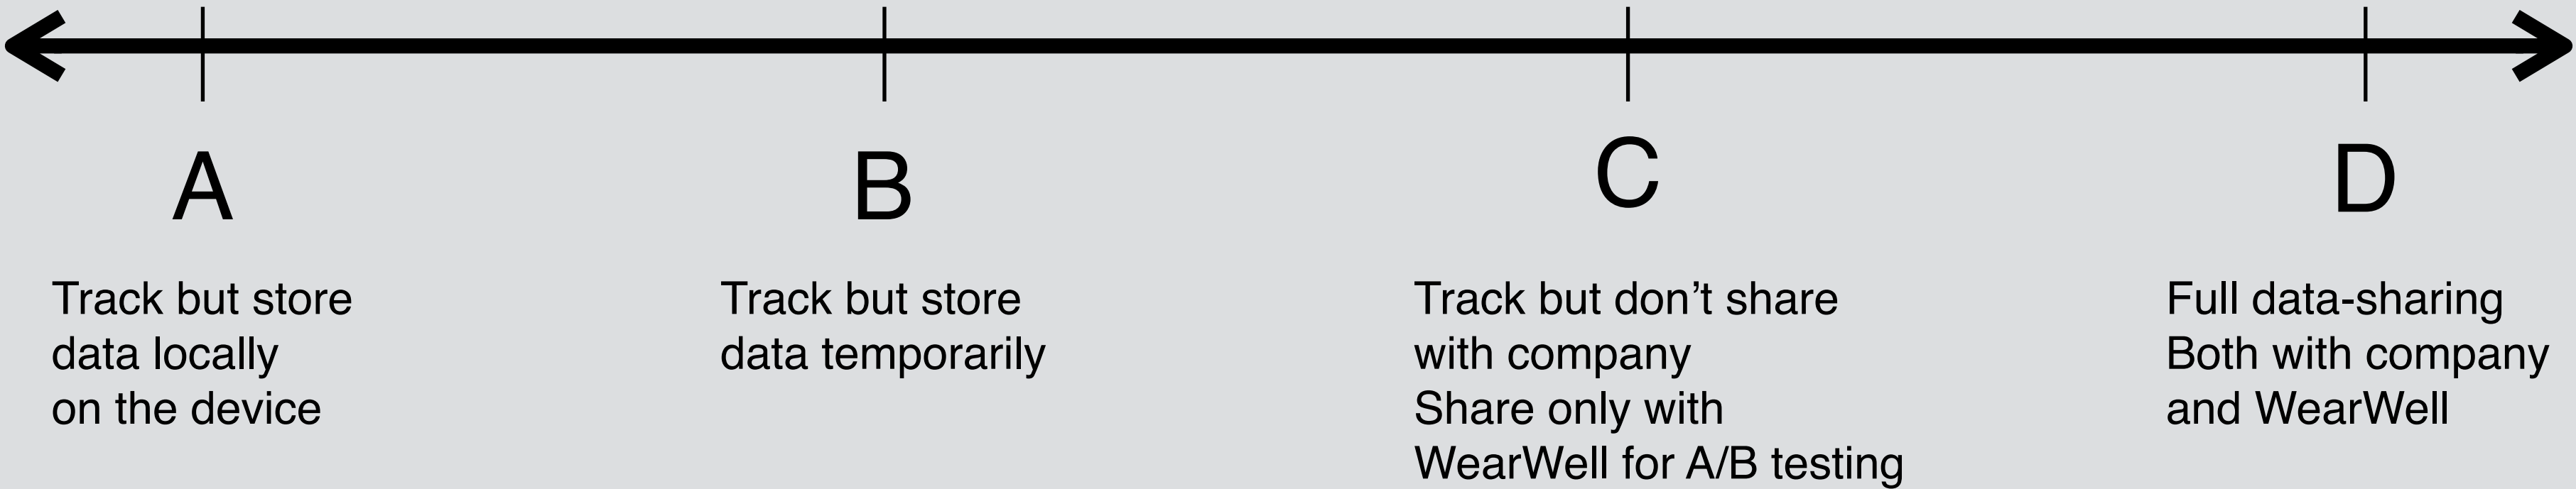

Other options:

1. other sensors?
2. data storage & management options?

the axis of options

Option A

Track but store data locally on the device
Company gets aggregate reports

Option B

Track but store data temporarily
Company gets aggregate reports

Option C

Track but don't share with client company
Share only with WearWell for A/B testing
Company gets aggregate reports

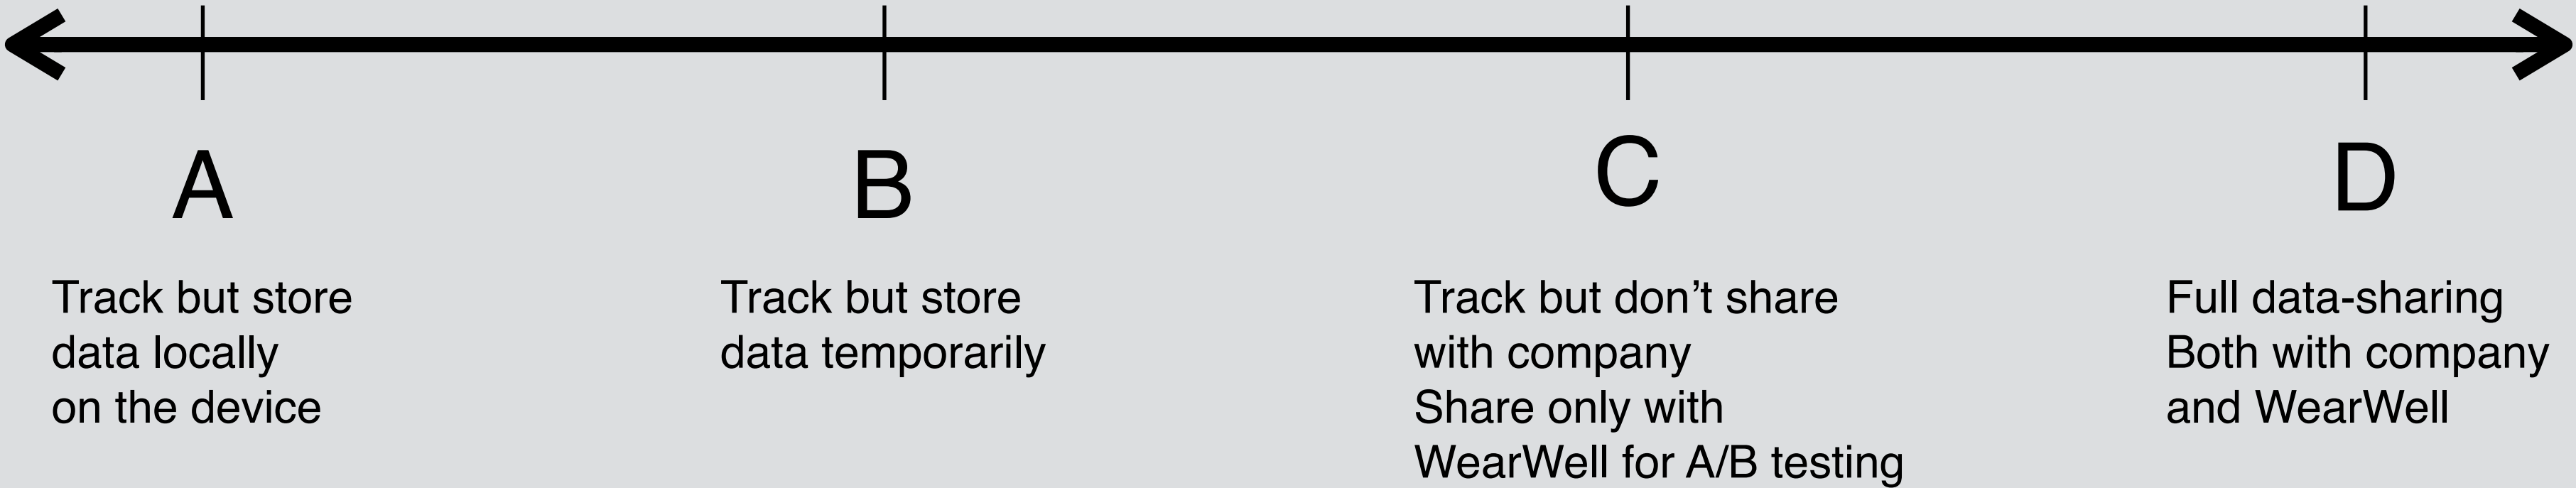

Option D

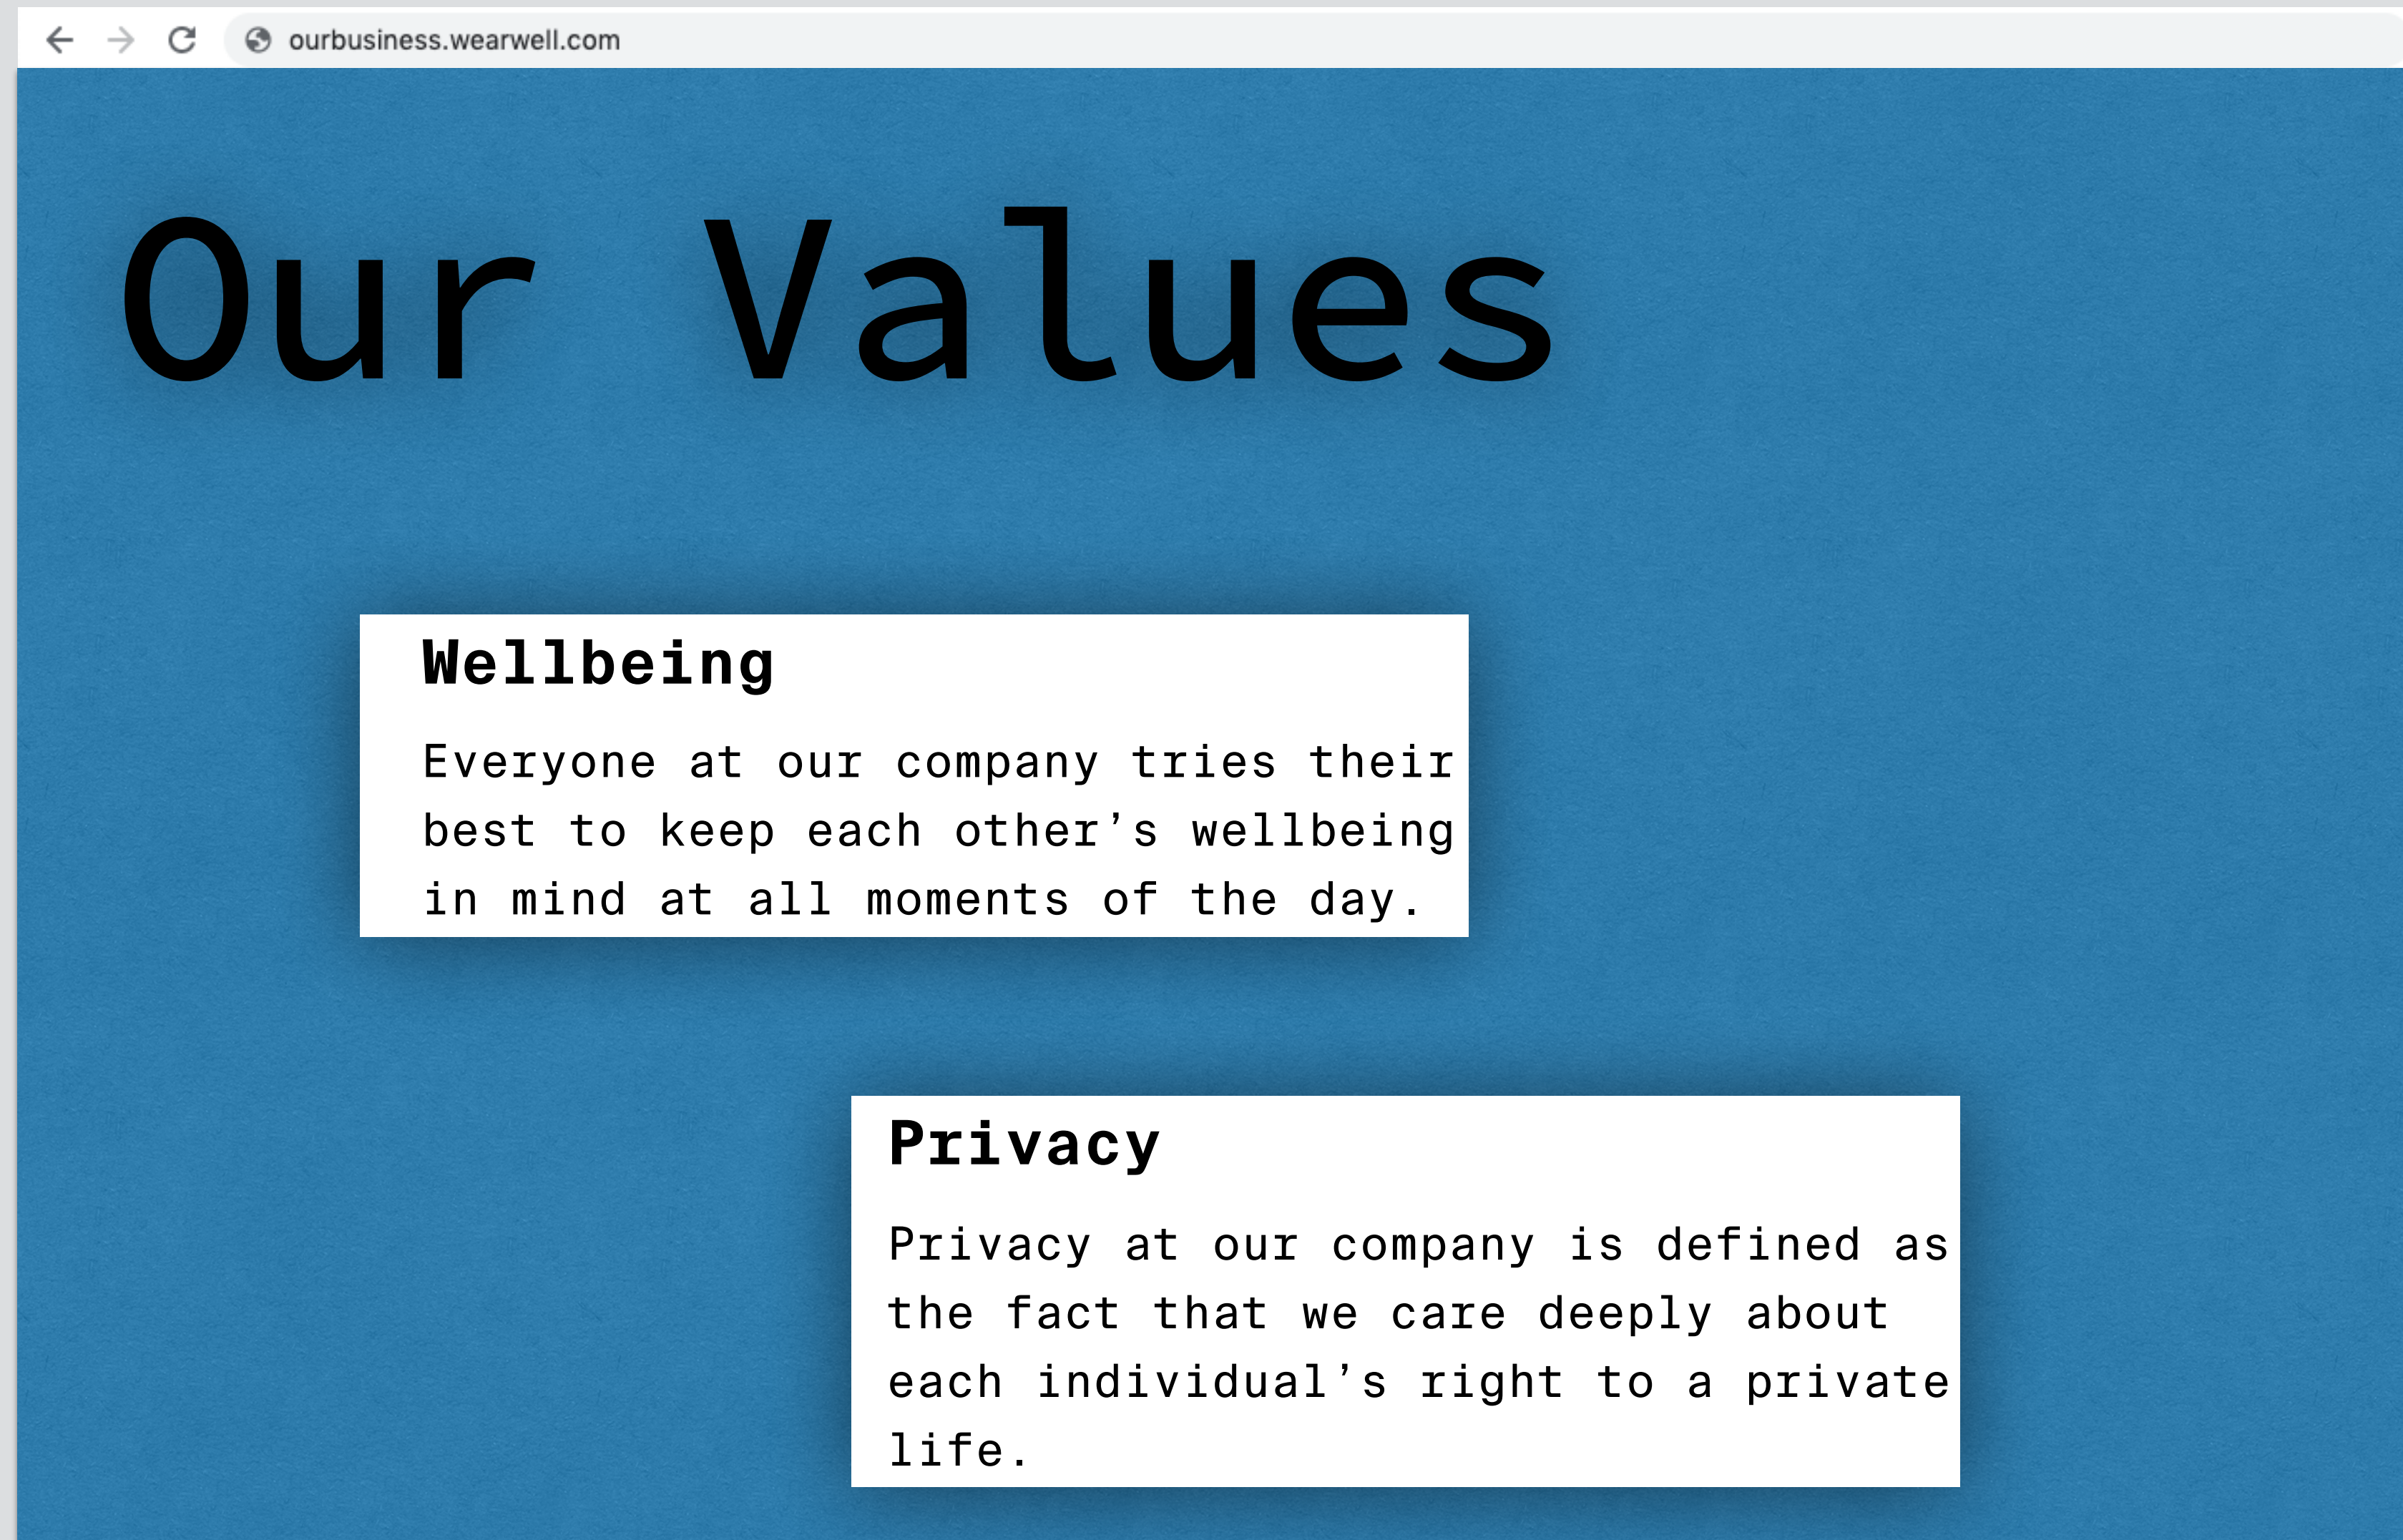

Full data-sharing with company, WearWell and any third-parties that are relevant

User Interview

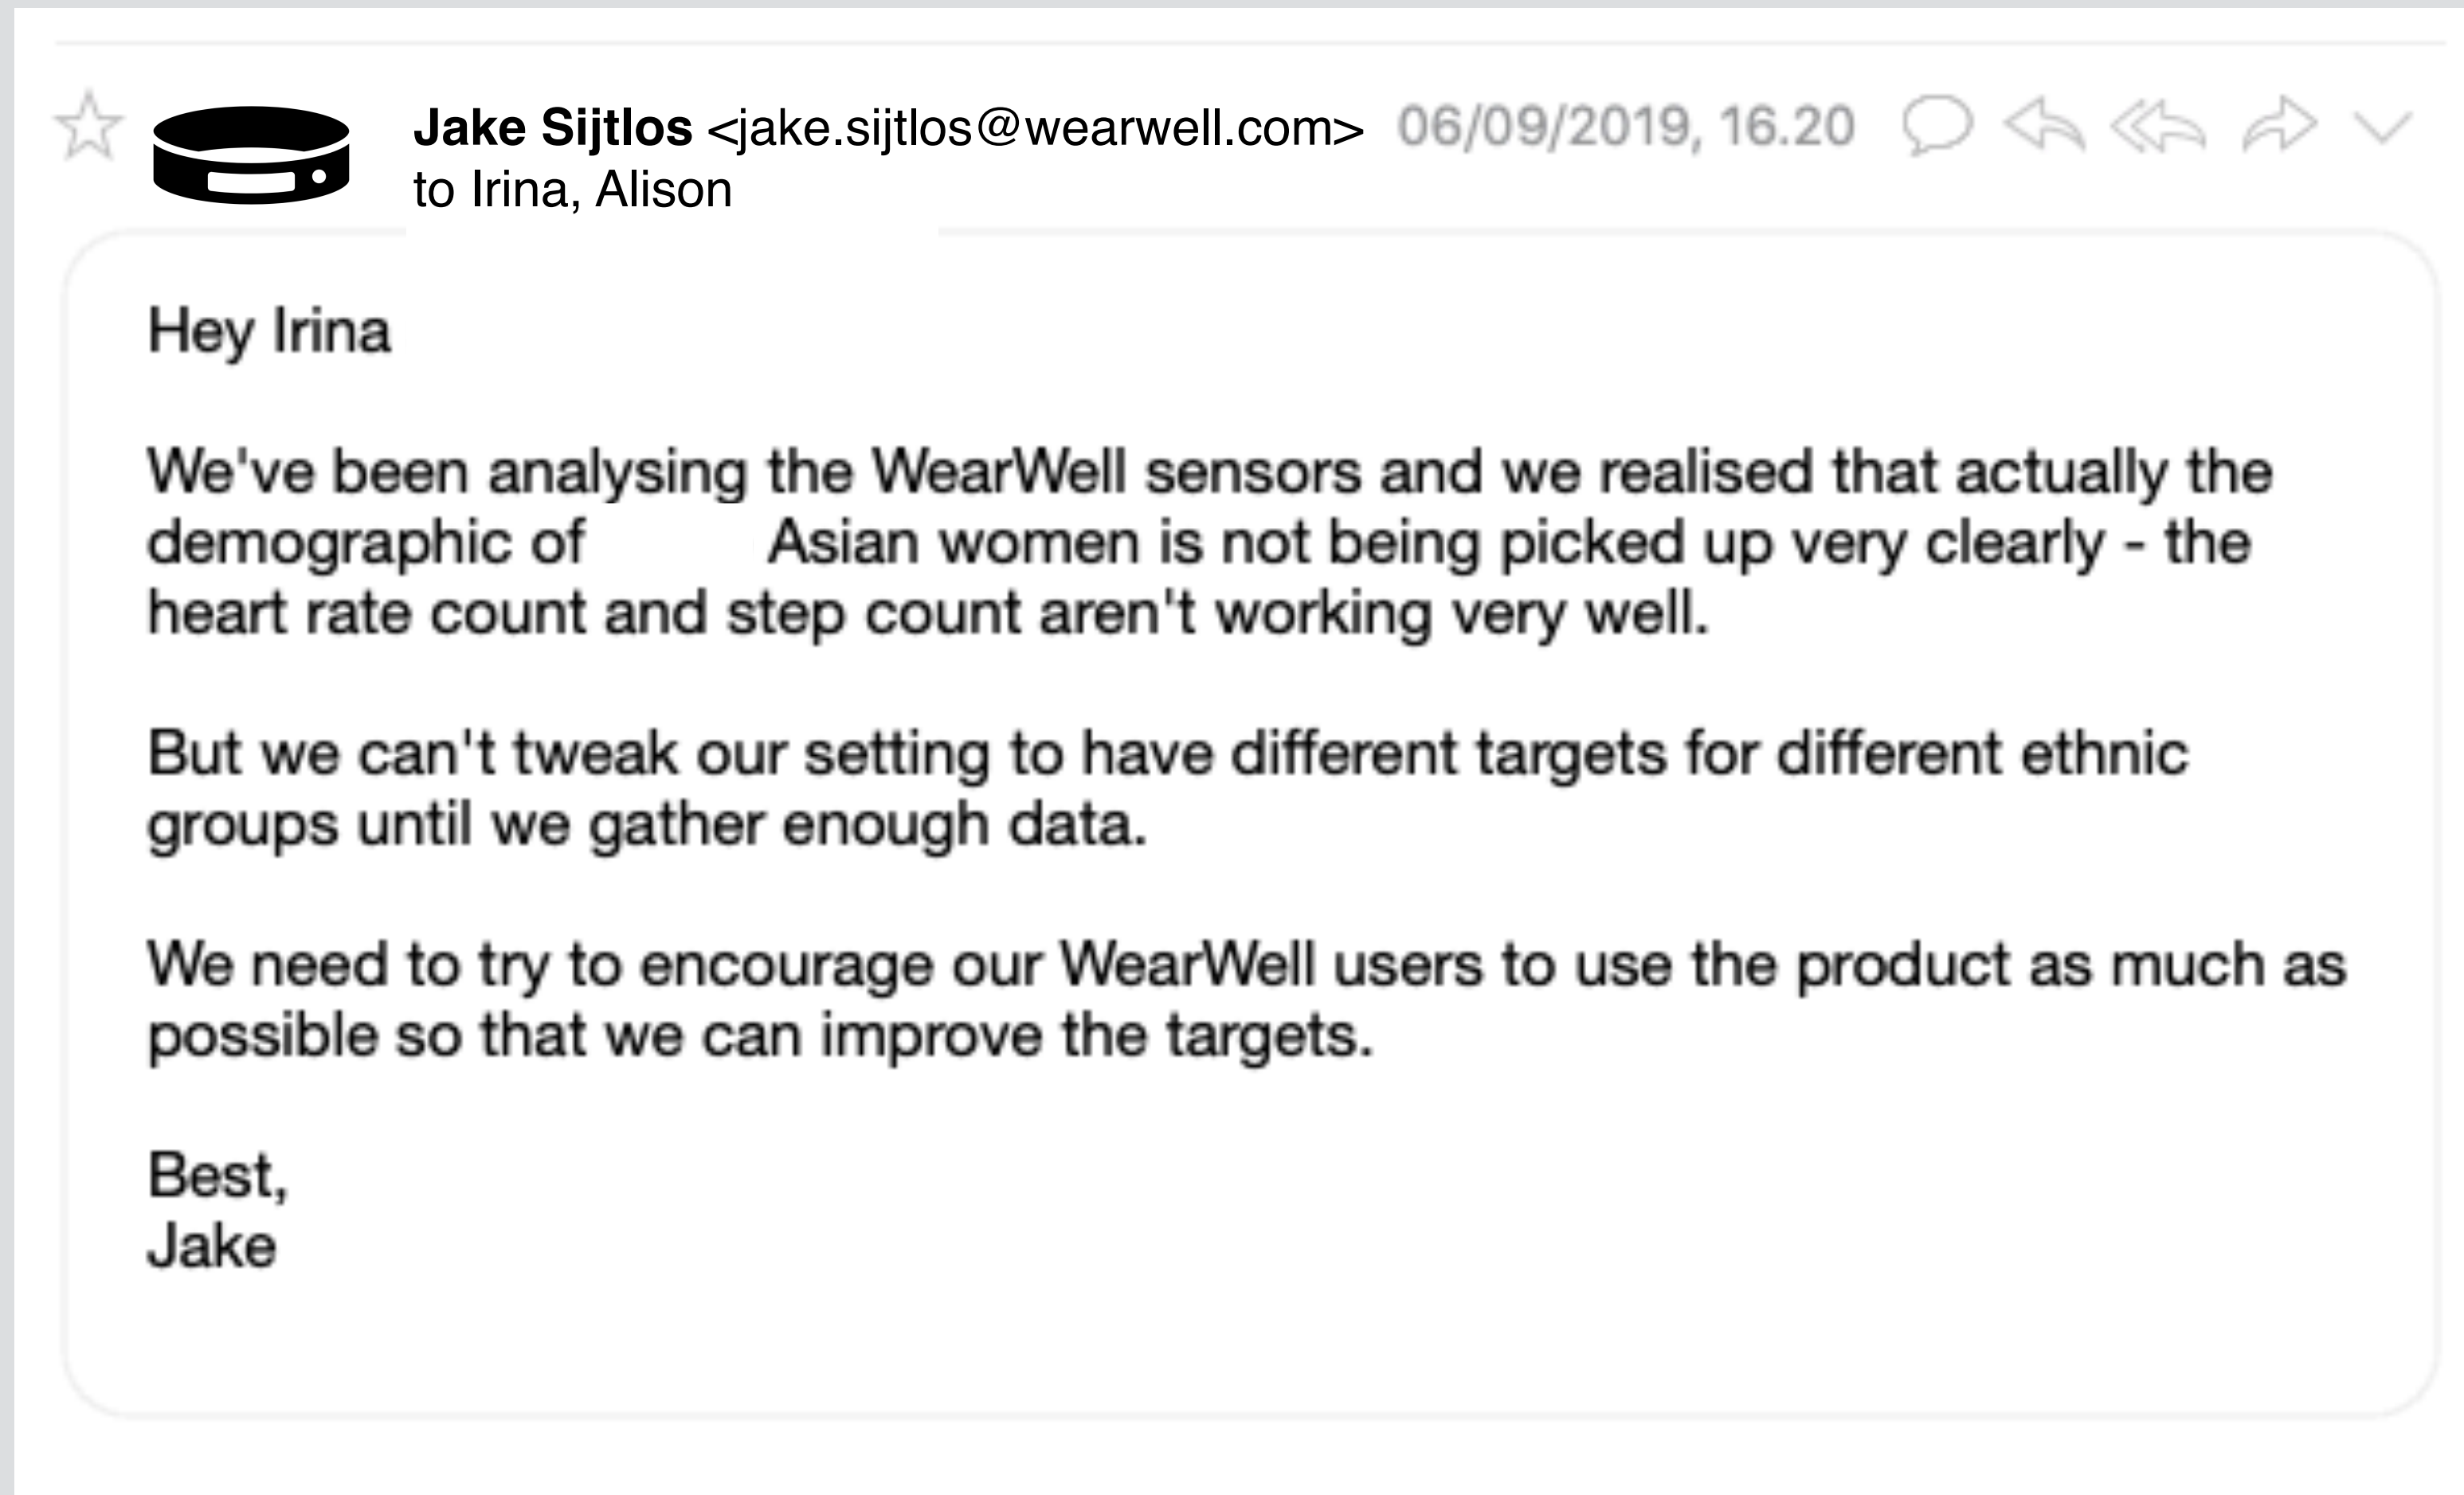

Let's have a user interview with one of the employees in a company that is currently testing the WearWell prototype. She works at the Sales Department and she's a mother of two.

if only we'd known

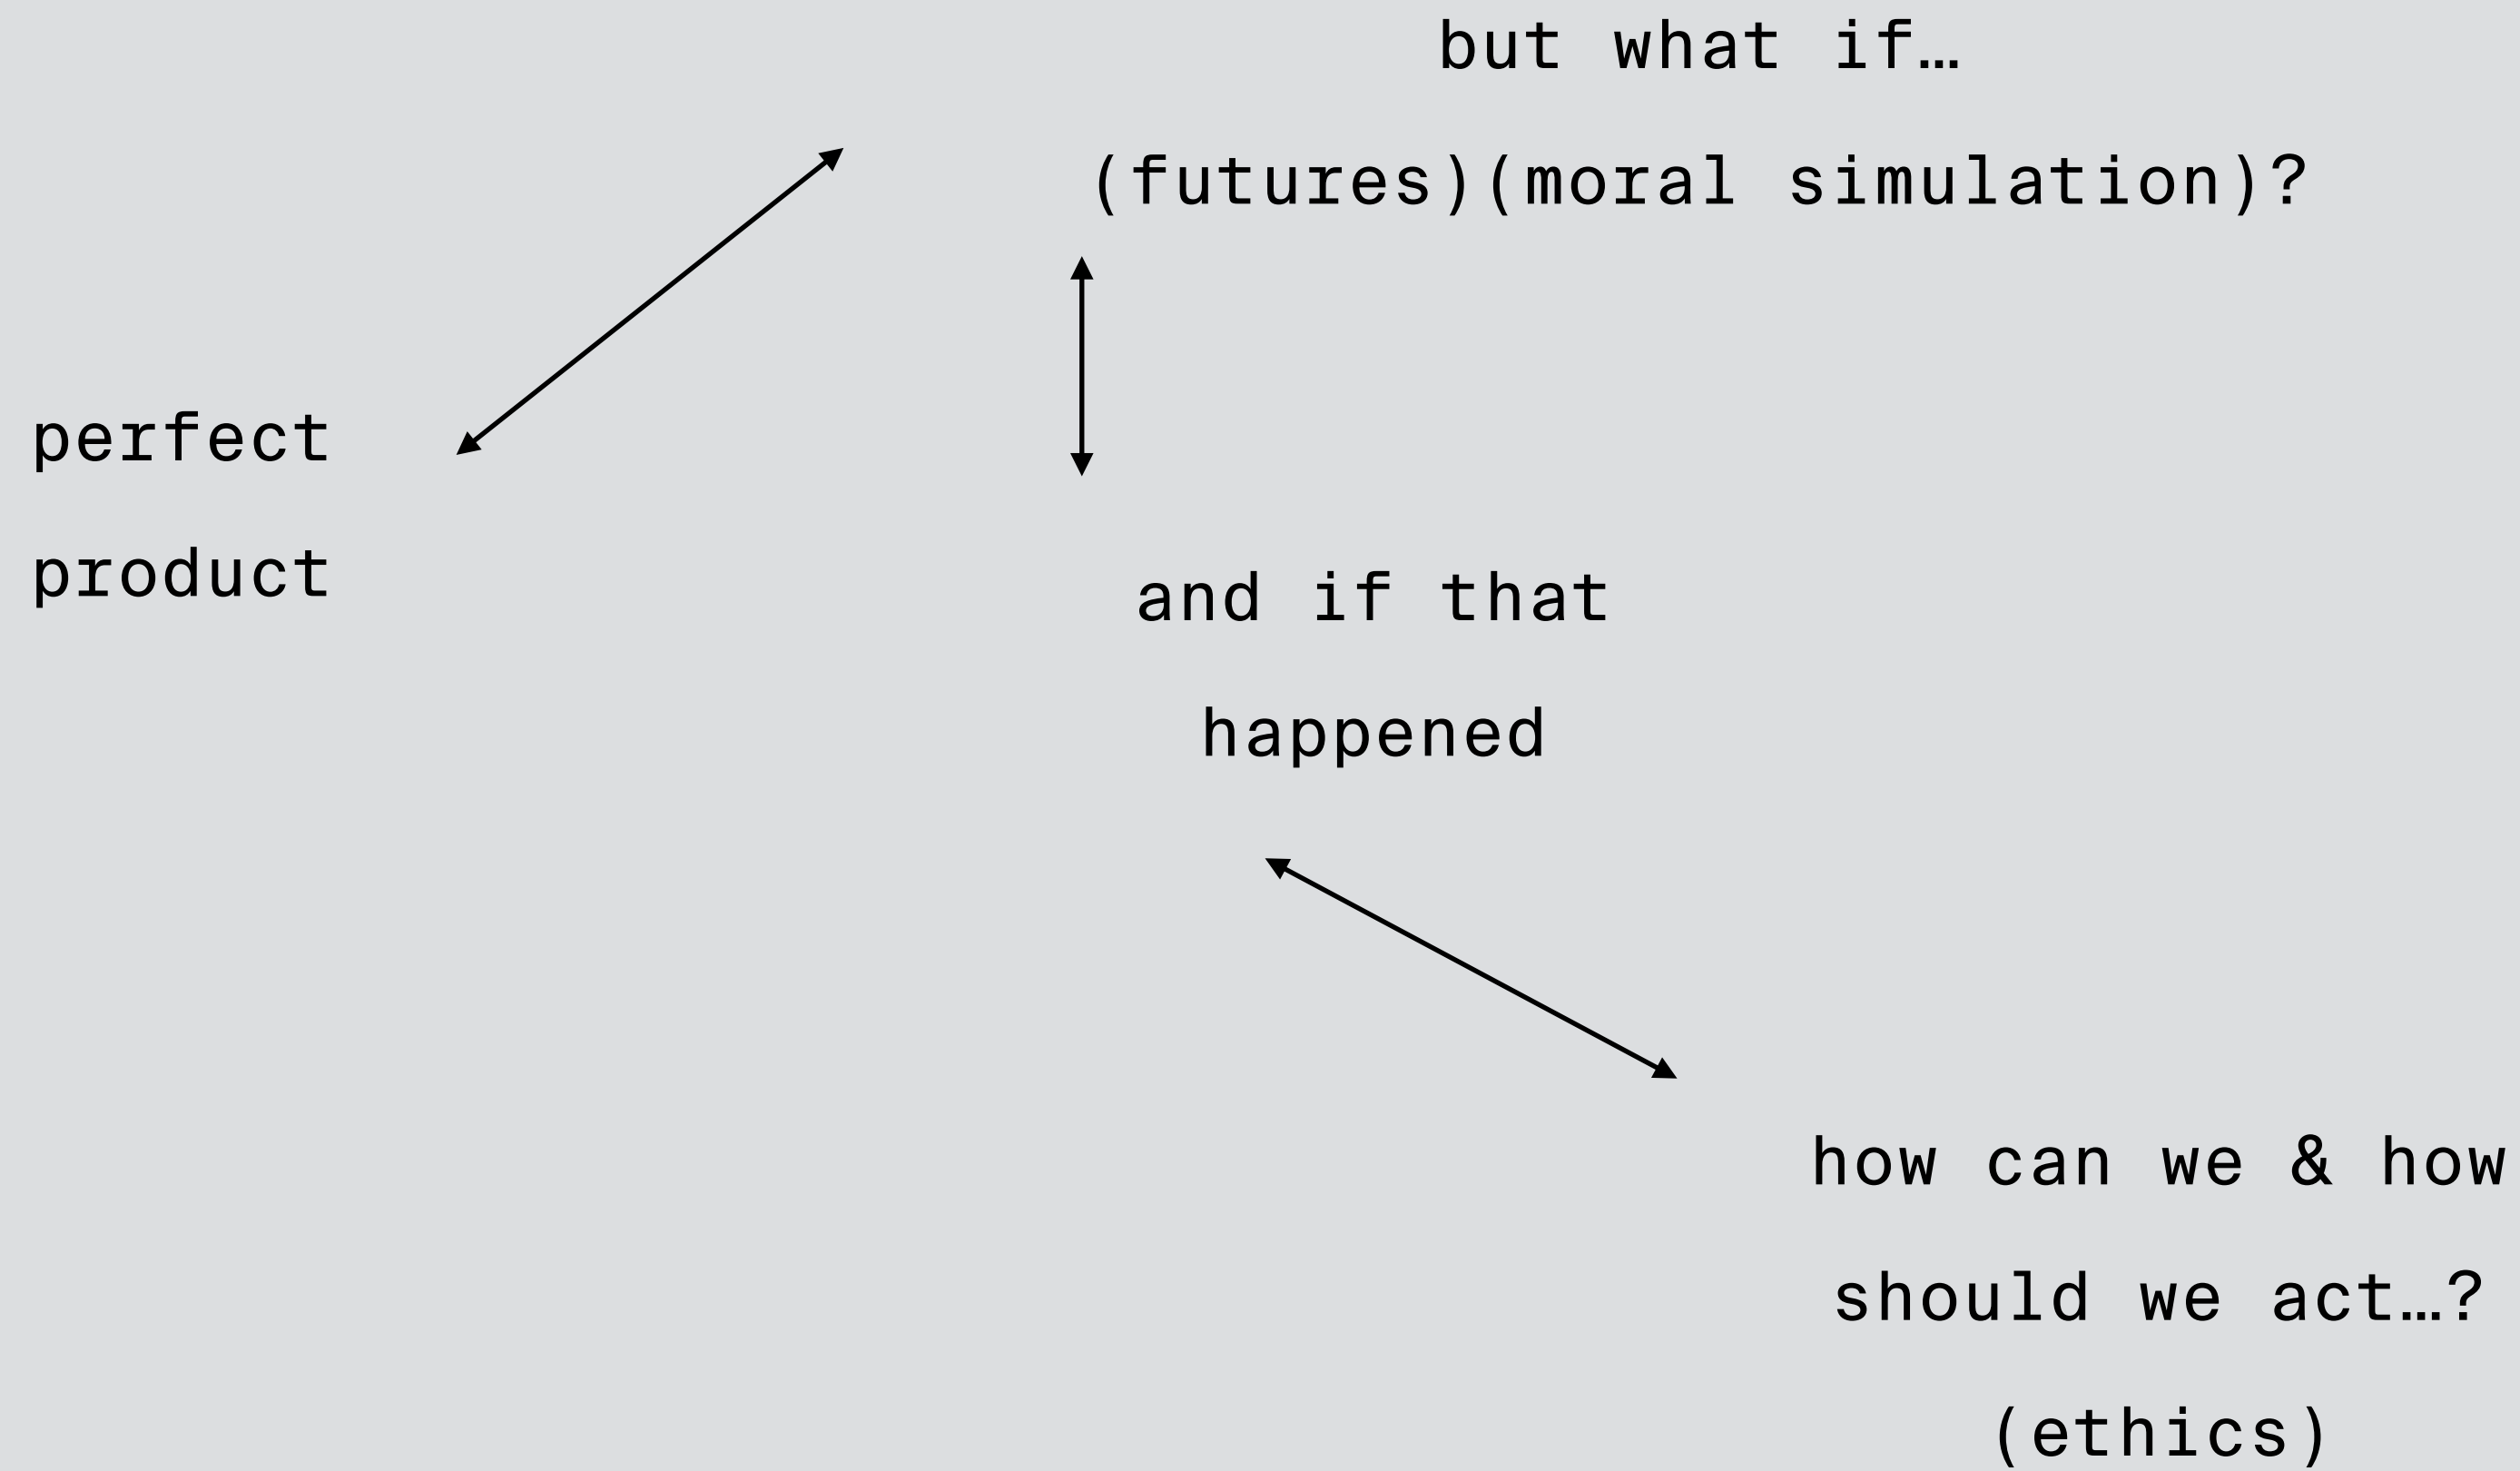

Maybe developers and designers (and entrepreneurs & investors) could have asked themselves if there were any other ways in which their product could be used [ethics] and thought about what would happen if everyone in the world had their product for a few years [futures]

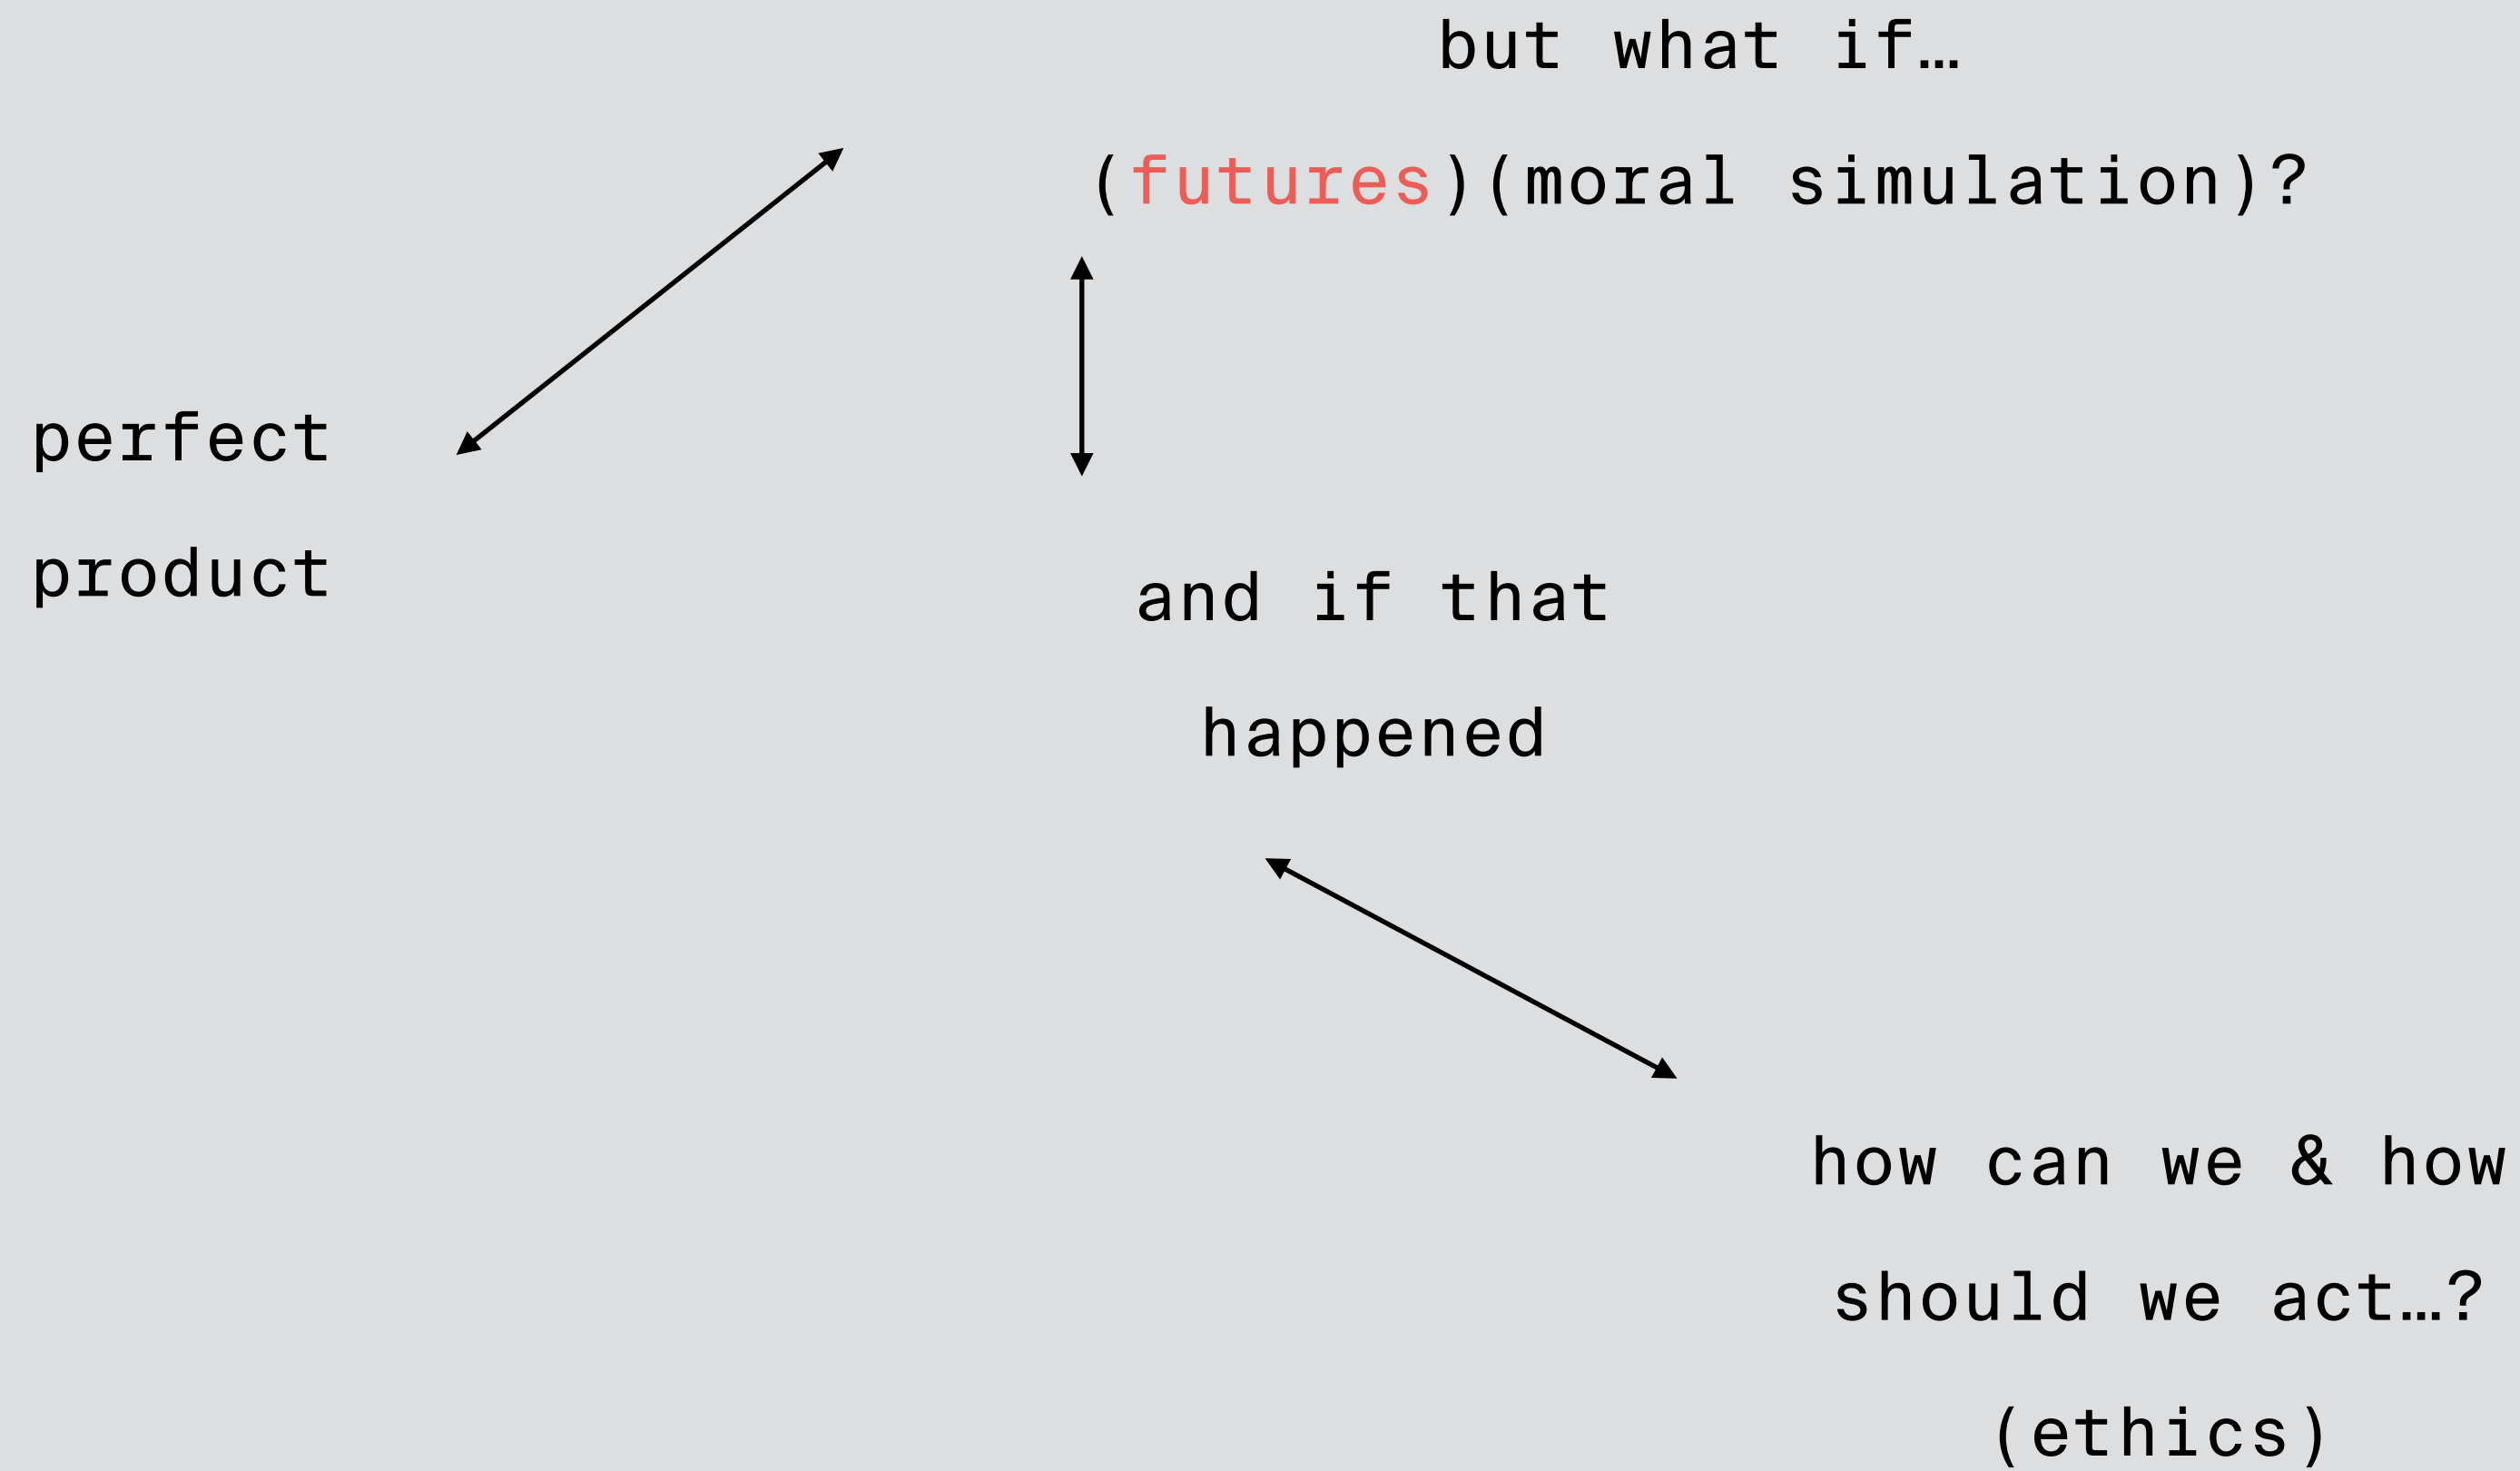

why do we worry?

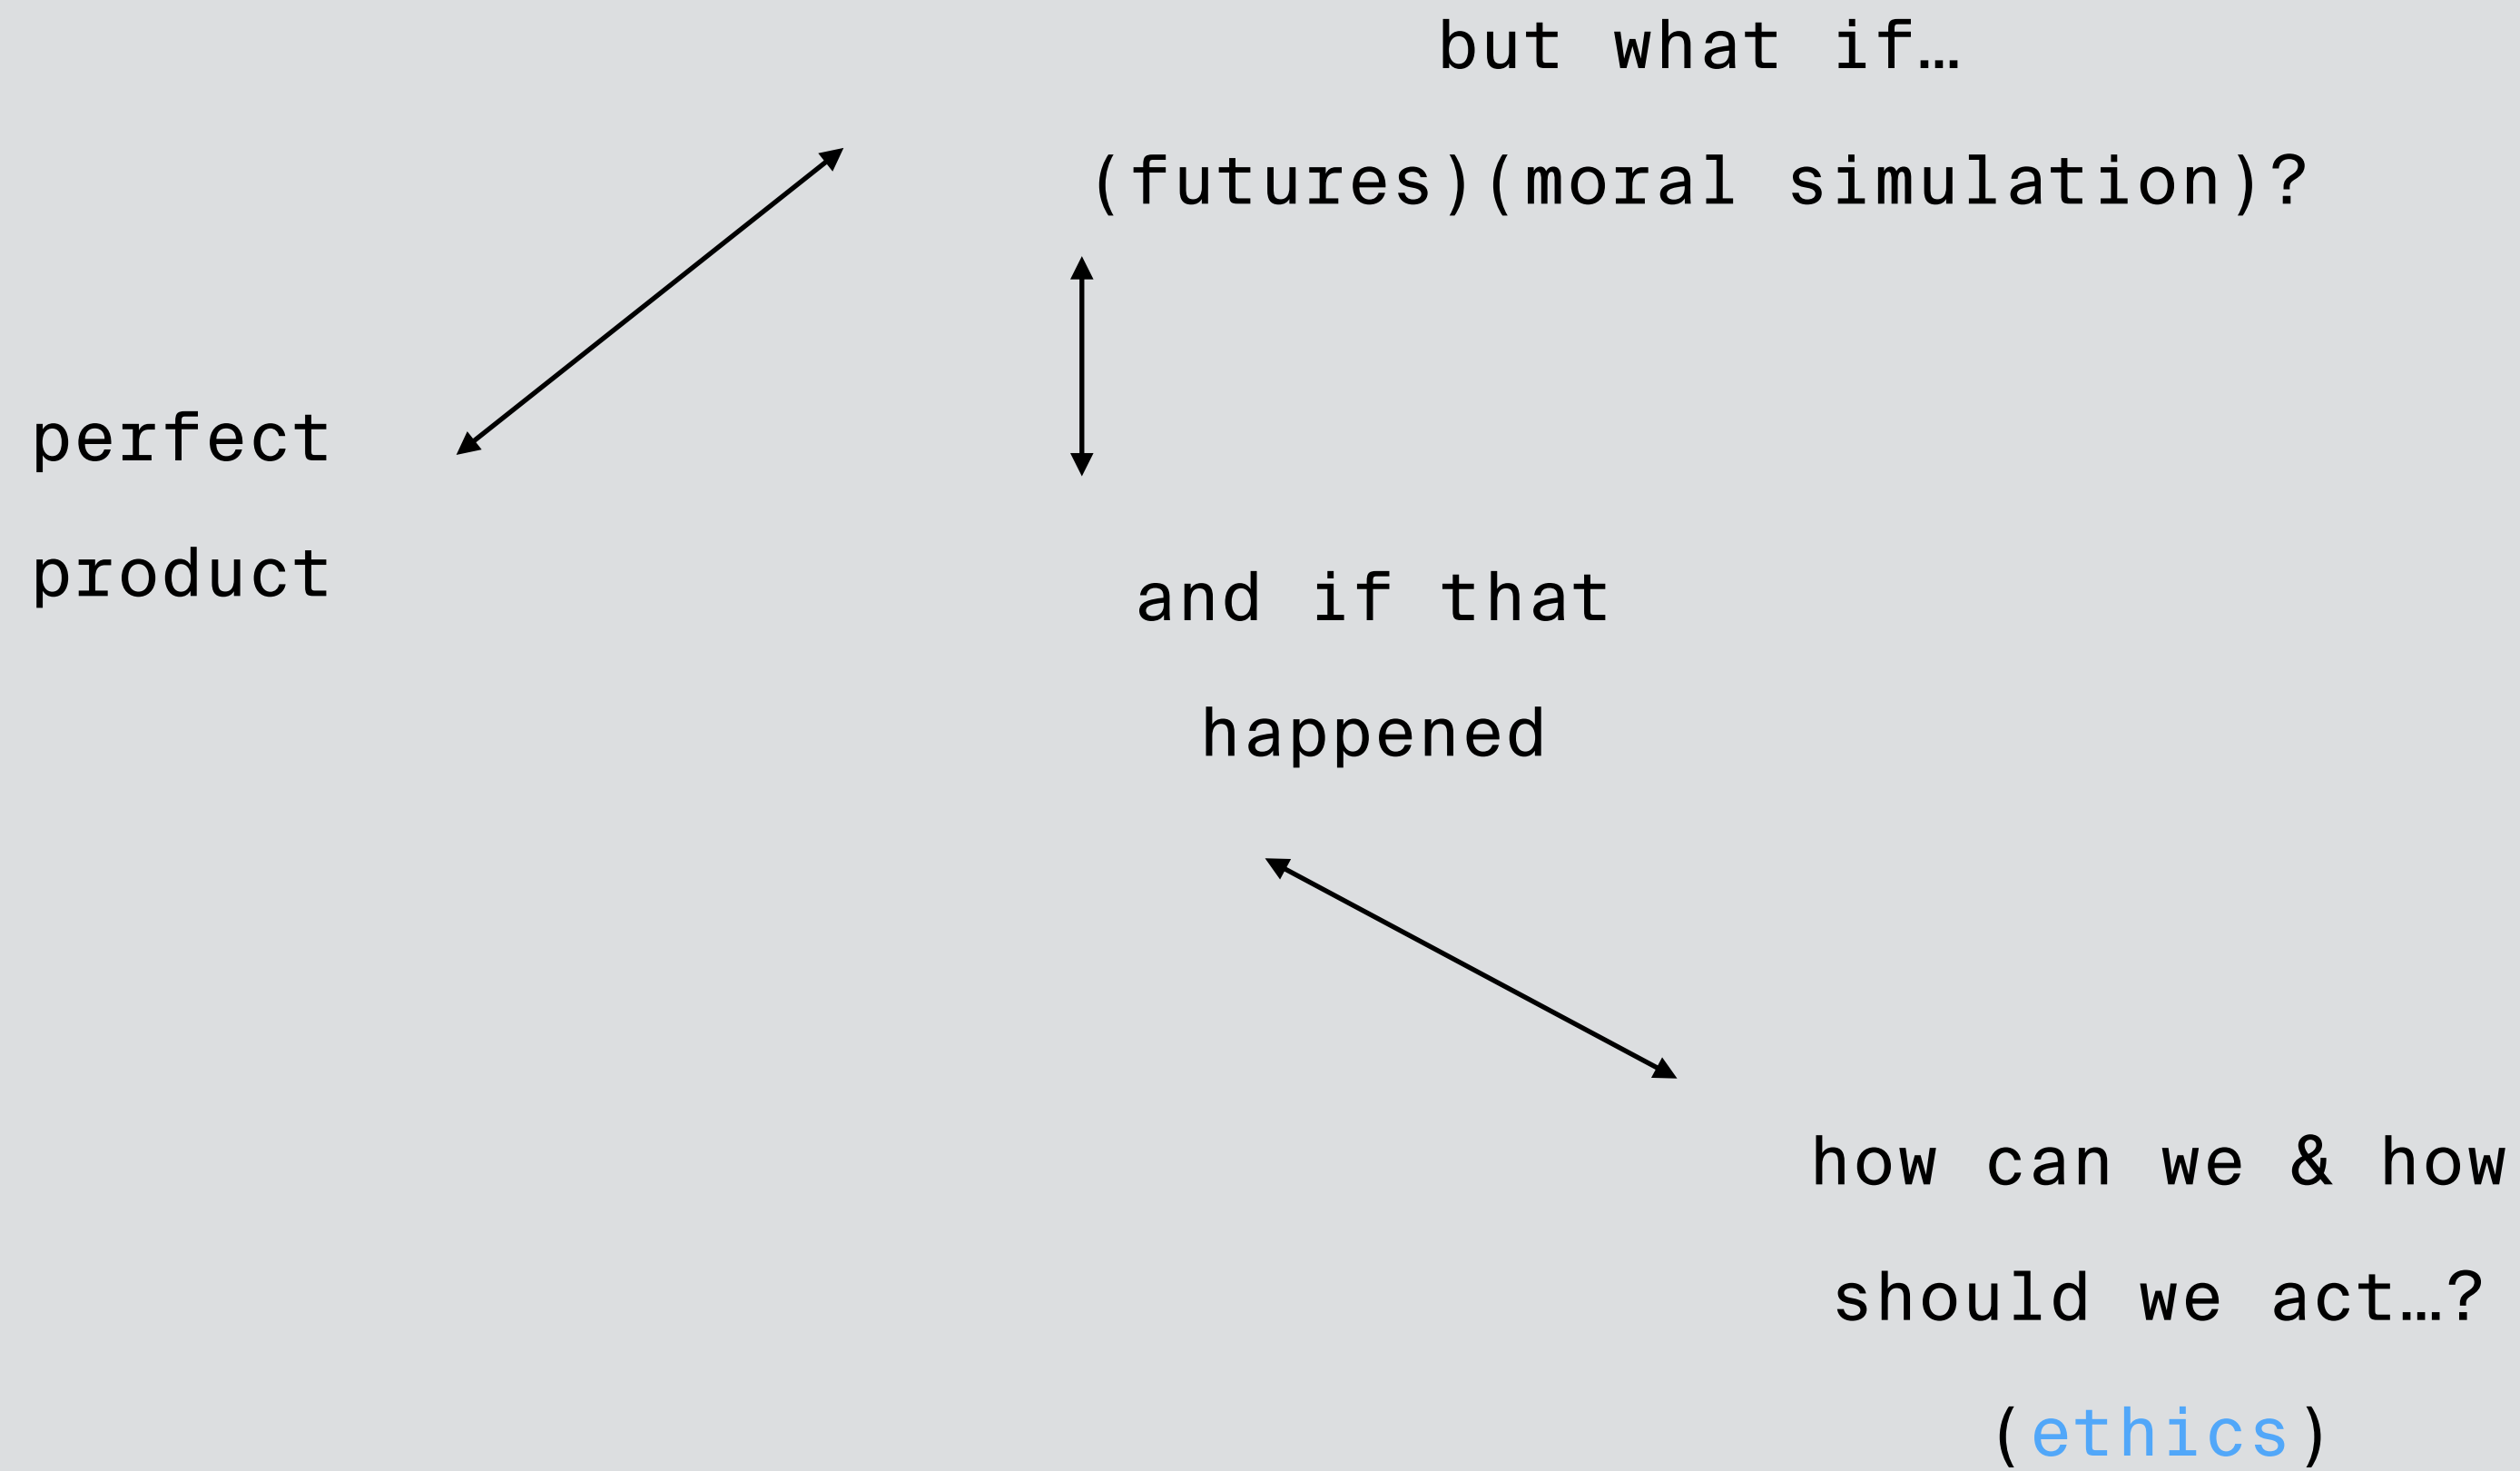

As a starting point to identifying an “opportunity”, challenge, or possible point of intervention
